

## Capstone Project Analyses

In my experience in capstone 1 I learned a lot in this course. Customer needs, communication, time management, teamwork, and much more. The negative part about this course would be the pandemic. Most of my team could not meet because of pandemic or because they were busy at their jobs. Positive about this course is that the profesores were a great help and always found alternative options.

The most challenging moment would be working in a team who are used to face to face interaction and everyone working more due to this pandemic. While working on this project I discovered we had very bad inconsistency between our project submission, for example if one teammate is done with their opart the other two did not know, so we fell behind. I also had a problem with my GitHub account where I was flagged and to this day they are mo lifting the flag ban. The most challenging moment was when we actually started on the project and realized that it's not the right software we were supposed to be using. It took time but we solved it pretty quickly.

The most powerful learning moment was when we used software AWS, I never knew Amazon had a web developing software which was so easy to use. I am a portrait photographer and I do have a website from a third party web service called WIX, but I will be making my personal website on AWS. The most important thing I learned personally is always have a timeline and stick to it, and always have an alternative option, when I got flagged from GitHub, which I still

You recently used a password to access the repository at `mueez30011/portfolio` with `git` using `git/2.23.4`.

Basic authentication using a password to `Git` is deprecated and will soon no longer work. Visit <https://github.blog/2020-12-15-token-authentication-requirements-for-git-operations/> for more information around suggested workarounds and removal dates.

Thanks,  
The GitHub Team

am I was not able to be un flagged, so I created a new account and then realize I cannot connect my AWS to GitHub anymore.

It was really a team decision when It came to final best solution. I think 3 minds are better than 1.

When It came to real world situations and problems, I feel that this is what this class was about.

Having a real client and a real-life problem and solving them.

The most got in the way of my progress, if anything is my work and not have the real interaction with team members.

Communication was a very big issue because most of the time we were communicating via text messages. I think yes at certain times I was not available because of my work so the meeting was being recorded for me to get caught up.

Google is a very informative software if we were stuck or had an obstacle we were using google for problem solving, but over all, all the team members were very well educated and had a strong background knowledge, so it wasn't an issue when it came to some things my teammates did that helped me to learn or overcome obstacles.

My greatest strength was, that I would say, is that I was physically showing up to the class and asking questions. I was even taking questions for my team members and asking in class. My biggest area of improvement would be communication and acknowledgement in web developing software.

If I approach the same problem again in the future, I would solve it the same way I solved it in this project. I was very proud of the Demo website we had created for our client.

I could teach this problem-solving process to someone else easily because it was not a hard or complicated project.

I would like to improve my communication skills and the tools I use for them. Next time I would give everyone a set job and deadlines and 1 software application that we can communicate on not text message or Facetime but something we will use in a professional environment.

What I learned in this class I will use in the future, understanding that time management is a very important part of my career and delivering what the client has requested for.
